

## **Experiment 31: WordPress to Demonstrate Anchor Tag, Title Tag, etc.**

### **Aim**

To create a simple web blog using **WordPress** and demonstrate the use of HTML elements such as **Anchor Tag, Title Tag, Heading Tags, Paragraph Tag, Image Tag, and List Tags**.

### **Objectives**

1. To understand the basics of creating a blog using WordPress.
2. To learn how to create and manage web pages and posts.
3. To demonstrate the use of HTML tags in a blog.
4. To create hyperlinks using the Anchor <a> tag.
5. To use the Title <title> tag and different heading tags.
6. To improve basic web-design skills.

### **Algorithm**

1. Open WordPress and create a new website/blog.
2. Log in to the WordPress dashboard.
3. Create a new page or post.
4. Add a suitable title to the blog.
5. Add headings and paragraph content.
6. Insert an image using the Image element.
7. Add a hyperlink using the Anchor <a> tag.
8. Add lists using ordered or unordered list elements.
9. Preview the blog and check all links and content.
10. Publish the blog.

## # Web Blog using Python

```
html = ""
```

```
<!DOCTYPE html>

<html>

<head>

  <title>My Technology Blog</title>

</head>

<body>

  <h1>Welcome to My Technology Blog</h1>

  <h2>About Technology</h2>

  <p>
    Technology makes our daily life easier and helps us
    communicate, learn and work efficiently.
  </p>

  <h2>Useful Website</h2>

  <a href="https://www.google.com">
    Visit Google
  </a>

  <h2>Technology Topics</h2>

  <ul>
    <li>Artificial Intelligence</li>
    <li>Web Development</li>
    <li>Cloud Computing</li>
    <li>Cyber Security</li>
  </ul>
```

```
</body>
```

```
</html>
```

```
"""
```

```
# Save the blog as an HTML file
```

```
with open("blog.html", "w") as file:
```

```
    file.write(html)
```

```
print("Web Blog Created Successfully!")
```

```
print("HTML file created: blog.html")
```

```
print("\nTags Demonstrated:")
```

```
print("1. Title Tag")
```

```
print("2. Heading Tag")
```

```
print("3. Paragraph Tag")
```

```
print("4. Anchor Tag")
```

```
print("5. Unordered List Tag")
```

```
print("6. List Item Tag")
```

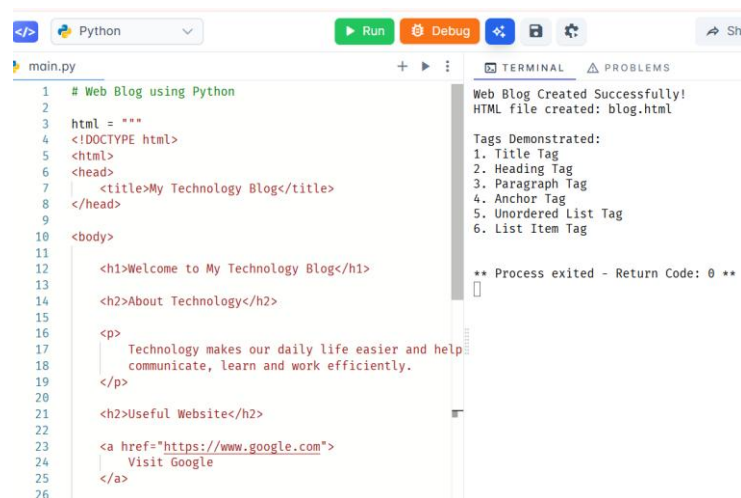

## Tags Demonstrated

| Tag        | Purpose                              |
|------------|--------------------------------------|
| <title>    | Defines the title of the web page    |
| <h1>, <h2> | Creates headings                     |
| <p>        | Creates a paragraph                  |
| <a>        | Creates a hyperlink                  |
| <ul>       | Creates an unordered list            |
| <li>       | Creates a list item                  |
| <body>     | Contains the visible webpage content |

Output:

## Tag

## Purpose

```
1 # Web Blog using Python
2
3 html = """
4 <!DOCTYPE html>
5 <html>
6 <head>
7   <title>My Technology Blog</title>
8 </head>
9
10 <body>
11
12   <h1>Welcome to My Technology Blog</h1>
13
14   <h2>About Technology</h2>
15
16   <p>
17     Technology makes our daily life easier and help
18     communicate, learn and work efficiently.
19   </p>
20
21   <h2>Useful Website</h2>
22
23   <a href="https://www.google.com">
24     Visit Google
25   </a>
26
```

Web Blog Created Successfully!  
HTML file created: blog.html

Tags Demonstrated:

1. Title Tag
2. Heading Tag
3. Paragraph Tag
4. Anchor Tag
5. Unordered List Tag
6. List Item Tag

\*\* Process exited - Return Code: 0 \*\*

## Result

A simple **WordPress web blog** was successfully created, demonstrating the **Title Tag, Heading Tags, Paragraph Tag, Anchor Tag, and List Tags**.

## Conclusion

The experiment helped in understanding how HTML elements such as hyperlinks, titles, headings, paragraphs, and lists are used in web pages.
